I. INTRODUCTION

This report has been prepared to describe and document (through engineering calculations and related technical data) the stormwater management system designed for a project known as Venue at Hopewell, which is proposed by Deer Valley Realty, Inc, upon Lots 19, 20, 45.01, 46 & 60 of Block 93 in the Township of Hopewell, Mercer County, New Jersey. This report accompanies a set of drawings entitled "Preliminary and Final Major Subdivision & Preliminary and Final Site Plan for Venue at Hopewell" which were prepared by Bowman Consulting Group, Ltd.; dated June 25, 2024. The set of Preliminary and Final Major Subdivision & Preliminary and Final Site Plans illustrate the existing and proposed conditions upon the subject property, as well as provide details for the various stormwater management facilities described herein. Therefore, this report should be reviewed and considered in conjunction with the above referenced Site Plans.

A. Location and Description of Project Site

The subject property is known on the Township of Hopewell tax map as Block 93, Lots 19, 20, 45.01, 46 & 60, consisting of approximately 185.51 acres in total. The property fronts Nursery Road to the south and Scotch Road to the east with a combination of residential, farmland and undeveloped properties to the south and west.

With respect to soil conditions on the project site, the *NRCS Soil Survey for Mercer County, New Jersey* identifies many types of soils within the project limits. The NRCS Soils Resource Report is included in Appendix 1 of this report. The onsite soils identified were used in the hydrologic and hydraulic modeling for this report.

B. Project Description

The Venue at Hopewell project will include site improvements for the construction of 272 single-family home units, 118 duplex units, 120 COAH Affordable Housing units, and 90 MF-10 Affordable Housing units, for a total of 600 units at the subject property. The proposed project will have corresponding improvements including but not limited to, roads, parking lots, roundabouts, stormwater basins, lighting, utility, landscaping, tennis courts, pickleball courts, a playground, bocce courts, dog parks, and a clubhouse facility. Approximately 128.74 acres of the 185.51-acre tract will be disturbed for the proposed improvement associated with the project.

II. OVERVIEW OF REGULATORY REQUIREMENTS

The storm water management system for the proposed Venue at Hopewell project has been designed to comply with current regulatory requirements and standards. The applicable regulations and standards are as follows:

- The State of New Jersey's "Stormwater Management Rules", as set forth at NJAC 7:8
- Section 17-82 – Stormwater Control of the Township's Ordinances.
- The Stormwater Management requirements of the County of Mercer
- The "Residential Site Improvement Standards" (NJAC 5:21), hereinafter referred to as the "RSIS;" and
- The "Standards for Soil Erosion and Sediment Control in New Jersey"

Compliance with each of the above-referenced standards necessitates the preparation of a storm water management plan and design that addresses multiple considerations with respect to post-development storm water runoff. These considerations are as follows:

- Use of Non-Structural Strategies to the maximum extent practicable
- Maintenance of average annual groundwater recharge volume
- Compliance with applicable Water Quality Management Standards
- "Quantity Control," achieved through peak flow attenuation
- Minimization of erosion and sedimentation
- Assuring effective operation and maintenance for the system

The remainder of this report will detail the manner in which the project's stormwater management design has addressed each of the above considerations, except for the requirements relevant to maintenance. The maintenance requirements will be addressed in a separate document entitled "Stormwater Management System Operations & Maintenance Manual for Venue at Hopewell; Block 93, Lots 19, 20, 45.01, 46 & 60, Township of Hopewell, Mercer County, New Jersey." However, the Maintenance Manual has not been prepared at this time, pending review and approval of the system's design.

The Appendices of this report contain engineering calculations and related technical documentation supporting the project's design as described herein.

III. METHODOLOGIES

This section of this report describes the engineering methodologies employed for the design of the project's storm water management system. All of the methods are specifically referenced in the applicable regulations and/or in one or more of the "References" listed in Section VIII of this report. Most of the methods are specified and/or detailed in *The New Jersey Stormwater Best Management Practices Manual*, hereinafter referred to as "the BMP Manual." Specifically, the various methods used in the preparation of the project's plans and stormwater management design to address each of the multiple considerations described above were as follows:

A. Estimates of Runoff Rates and Volumes

1. Pre-Development versus Post-Development

   The hydrologic estimates and modeling conducted for the design of the storm water management system utilized the "NRCS Methodology" which is specifically referenced for such applications in the BMP Manual. Storm frequencies of 2, 10 and 100-years were modeled, as required to demonstrate compliance with the "quantity control" provisions of the subject Rules. The models were created using the NOAA Type C, 24-hour rainfall. According to data published by the State Office of the Natural Resources Conservation Service the 24-hour rainfall depths for Mercer County for the three existing and future storm frequencies modeled are as follows:

   - 2-year = 3.35 inches
   - 10-year = 5.10 inches
   - 100-year = 8.59 inches

2. Runoff Coefficients and Times of Concentration

   All of the soils within the development area are included in Appendix 1 of this report.

   In addition to CN values, the above referenced NRCS Methodology for estimating stormwater runoff rates also necessitates the determination of a time of concentration for each subwatershed/drainage area.

3. Weighted Average Volume Technique

   As stated in the BMP Manual, variations in cover conditions are not always accurately reflected by calculating a weighted CN value for the entire subwatershed. Rather, a procedure termed the "weighted average volume technique" was presented and recommended in the BMP Manual for such subwatershed areas. Therefore, runoff estimates for the subwatershed areas with directly connected impervious surface considered in the design of the project's stormwater management system utilized the weighted average volume technique. In such cases, two hydrographs (one representing the

impervious area within the area and the other representing the remaining area) were developed for the subwatershed. The hydrograph representing the impervious area was given the suffix "I" for identification, while the hydrograph representing the remainder of the subwatershed area was given the suffix "P".

B. Water Quality Management

Pursuant to applicable standards and regulations, this design consideration was based on the "Water Quality Design Storm" as specified in the BMP manual. Specifically, the storm is based upon a 1.25 inch rainfall event over the course of two hours as specified in Figure 5-2 of the BMP Manual.

C. Ground Water Recharge

Groundwater recharge standards and requirements apply to the proposed improvements associated with the project site and are satisfied by either:

1. Demonstrating through hydrologic and hydraulic analysis that the site and its stormwater management measures maintain 100 percent of the average annual pre-construction groundwater recharge volume for the site; or

2. Demonstrating through hydrologic and hydraulic analysis that the increase of stormwater runoff volume from pre-construction to post-construction for the projected two-year storm, as defined and determined pursuant to N.J.A.C. 7:8-5.7(d), is infiltrated.

Refer to the Tables and Appendices for details.

D. Erosion and Sedimentation Control

Another key consideration in the development of the project is the minimization of erosion and sedimentation. The greatest potential for erosion and sedimentation will occur during construction, when areas of exposed soils temporarily exist. The "Soil Erosion and Sediment Control Plan," which is included in the set of Site Plans referenced above specifies numerous proven measures for controlling erosion and sedimentation during construction.

This plan is subject to the review and certification by the Mercer County Soil Conservation District.

IV. EXISTING SITE CONDITIONS AND STORMWATER RUNOFF ESTIMATES

This section of this report describes the hydrologic modeling conducted to estimate peak runoff rates and total runoff volumes from the project site under existing conditions. Sheet 1 of 2 contained in **Appendix 4** of this report is an "Existing Conditions" Drainage Area Map prepared for the hydrologic assessment of stormwater runoff from the project site under existing conditions. As illustrated on Sheet 1 of 2, the drainage area was divided

into six watersheds flowing to three separate design points. The area of study includes 249.69 acres.

Design Point 1 is the total existing drainage area that flows to Ewing Creek, which consists of Drainage Area XDA-1 and Drainage Area XDA-2.

Drainage Area XDA-1 encompasses 91.57 acres of land. The area includes 86.99 acres of open space/woods/row crops and 4.58 acres of impervious area. Runoff from this area flows to Ewing Creek.

Drainage Area XDA-2 encompasses 35.20 acres of land, which is all considered to be row crops. Runoff from this area flows to Ewing Creek.

Design Point 2 is the total existing drainage area that flows to Jacobs Creek, which consists of Drainage Area XDA-3 and Drainage Area XDA-4.

Drainage Area XDA-3 encompasses 22.13 acres of land, which is all considered to be woods/row crops. Runoff from this area flows to Jacobs Creek.

Drainage Area XDA-4 encompasses 34.95 acres of land, which is all considered to be woods/row crops. Runoff from this area flows to Jacobs Creek.

Design Point 3 is the total existing drainage area that flows to Woolsey Creek, which consists of Drainage Area XDA-5 and Drainage Area XDA-6.

Drainage Area XDA-5 encompasses 8.76 acres of land, which is all considered to be row crops. Runoff from this area flows to Woolsey Creek.

Drainage Area XDA-6 encompasses 57.08 acres of land. The area includes 56.32 acres of woods/row crops and 0.76 acres of impervious area. Runoff from this area flows to Woolsey Creek.

The path used to estimate the time of concentration for each subwatershed is also illustrated on the subject Drainage Area Map. The calculations for the time of concentration, weighted CN value and peak runoff rates under existing conditions are provided in **Appendix 2.**

The peak rates of runoff for each of the storms studied are summarized in Table No. 1 below.

DESCRIPTION OF PROPOSED CONDITIONS

This section of this report describes the hydrologic modeling conducted to estimate peak runoff rates and total runoff volumes from the project site under proposed conditions. Sheet 2 of 2 contained in **Appendix 4** of this report is a "Proposed Conditions" Drainage Area Map prepared for the hydrologic assessment of stormwater runoff from the project site under proposed conditions. As illustrated on Sheet 2 of 2, the drainage area was divided into six watersheds flowing to six design points, each corresponding to a drainage area. The area of study includes 249.69 acres.

Drainage Area PDA-1 encompasses approximately 90.35 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-1 through B-17, and undisturbed areas. Runoff from this area flows to Ewing Creek.

Drainage Area PDA-2 encompasses approximately 33.93 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-18 through B-28, and undisturbed areas. Runoff from this area flows to Ewing Creek.

Drainage Area PDA-3 encompasses approximately 29.62 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-29 through B-40, and undisturbed areas. Runoff from this area flows to Jacobs Creek.

Drainage Area PDA-4 encompasses approximately 24.35 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-41 through B-47, and undisturbed areas. Runoff from this area flows to Jacobs Creek.

Drainage Area PDA-5 encompasses approximately 7.27 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-48 through B-50, and undisturbed areas. Runoff from this area flows to Woolsey Creek.

Drainage Area PDA-6 encompasses approximately 56.17 acres of land. The area is comprised of the drainage areas that discharge to bioretention basins B-51 through B-58, and undisturbed areas. Runoff from this area flows to Woolsey Creek.

The calculations for the time of concentration, weighted CN value and peak runoff rates under proposed conditions are provided in **Appendix 3.** The peak rates of runoff for each of the storms studied are summarized in Table No. 5 below.

VI. ASSESSMENT OF COMPLIANCE WITH STORMWATER MANAGEMENT REQUIREMENTS

This section of this report is intended to demonstrate that the stormwater management system designed for the Venue at Hopewell project, as above described, is compliant with all of the regulatory requirements pursuant to the applicable Rules. The various considerations relevant to the design of the system were listed in Subsection II of this report. To reiterate, these considerations are as follows:

- Maintenance of average annual groundwater recharge volume
- Compliance with applicable Water Quality Management Standards
- "Quantity Control," achieved through peak flow attenuation
- Providing an effective collection and conveyance system
- Assuring minimization of erosion and sedimentation
- Providing for proper maintenance of the system
- Use of Non-structural strategies

Except for the requirement relevant to the maintenance of the proposed system, this section of this report will address each of the above considerations with respect to complying with the applicable rules and standards. As indicated above, the requirement relevant to system maintenance is addressed in an accompanying report.

A. Maintenance of Average Annual Groundwater Recharge

As stated above, groundwater recharge standards and requirements apply to the proposed improvements associated with the project site and are satisfied by either:

1. Demonstrating through hydrologic and hydraulic analysis that the site and its stormwater management measures maintain 100 percent of the average annual pre-construction groundwater recharge volume for the site; or

2. Demonstrating through hydrologic and hydraulic analysis that the increase of stormwater runoff volume from pre-construction to post-construction for the projected two-year storm, as defined and determined pursuant to N.J.A.C. 7:8- 5.7(d), is infiltrated.

Refer to the Tables and Appendices for details.

B. Water Quality Management

The project proposes to increase the total impervious coverage on the site by approximately 50.98 acres. As this increase is greater than 0.25 acres, the regulatory requirements at NJAC 7:8-5.5 are applicable.

For the purposes of water quality, the NJDEP considers roof, sidewalks, patios and similar impervious areas "clean" and subsequently do not require TSS removal. The parking structures are included as analogous to pavement as it would generate TSS in runoff.

C. Quantity Control (Peak Flow Attenuation)

Under NJAC 7:8-5.6, there are four ways to satisfy runoff control. For this analysis, subparagraphs 1 and 3 are utilized.

Subparagraph 1 states: "*Demonstrate through hydrologic and hydraulic analysis that for stormwater leaving the site, post-construction runoff hydrographs for the current and projected two-, 10-, and 100-year storm events, as defined and determined pursuant to N.J.A.C. 7:8-5.7(c) and (d), respectively, do not exceed, at any point in time, the pre-construction runoff hydrographs for the same storm events*."

Subparagraph 3 states: "*Design stormwater management measures so that the post-construction peak runoff rates for the two-, 10-, and 100-year storm events are 50, 75, and 80 percent, respectively, of the pre-construction peak runoff rates. The percentages apply only to the post-construction stormwater runoff that is attributable to the portion of the site on which the proposed development or project is to be constructed*."

Table No. 62 & 63 below summarizes the existing and proposed peak runoff from the hydrographs and routing through the bioretention basins for Design Point 1 and demonstrates compliance with the regulatory requirements.

D. Soil Erosion and Sediment Control Compliance

The project has also been designed to minimize erosion and sedimentation in accordance with *The Standards for Soil Erosion and Sediment Control in New Jersey*" A "Soil Erosion and Sediment Control Plan" is included in the set of project plans, specifying numerous practices to achieve this goal. The project's "Soil Erosion and Sediment Control Plan" is subject to review and approval by the Mercer County Soil Conservation District (MCSCD). The District's certification of the plan is required before any construction may commence.

E. Collection and Conveyance System Design

The project's storm water management system also includes a network of storm sewer pipes to convey the stormwater runoff to and from the various management

facilities. Similarly, stormwater inlets are strategically located to collect runoff from the surface of the ground.

F. Use of Non-Structural Strategies

The design of the project's storm water management system also included the implementation of Non-Structural Strategies. Foremost, redevelopment in itself is a low impact design strategy as it takes under-utilized, previously developed land and creates new uses on it instead of developing virgin forest or farm fields. The site also implements non-structural strategies such as utilizing existing stabilized discharge points and preventative pollution source measures.

Re: Stormwater Management Testing Report
Venue at Hopewell
Hopewell Township, Mercer County, New Jersey

Dear Mitch:

In accordance with our agreement dated October 2, 2023, Geo-Technology Associates, Inc. (GTA) has performed a geotechnical exploration for the planning and design of stormwater management (SWM) facilities related to a proposed residential development to be constructed in Hopewell Township, Mercer County, New Jersey. The exploration consisted of excavating 152 test pits with in-situ infiltration testing, performing 60 basin flood tests, and visually classifying the encountered soils. The results of the field testing, and GTA's recommendations regarding the design and construction of the proposed SWM basins are included in this report.

GTA appreciates the opportunity to have been of assistance to you on this project. Please contact our office at (732) 271-9301 if you have questions or require additional information. Please note that, unless you make other arrangements, GTA will discard all soil samples obtained from the explorations 60 days after the date of this report.

Sincerely,

1.0 INTRODUCTION

This report presents the results of a geotechnical engineering exploration performed by Geo-Technology Associates, Inc. (GTA) for the planning and design of stormwater management (SWM) facilities related to a proposed residential development in Hopewell Township, Mercer County, New Jersey.

1.1 Study Purpose

GTA conducted this study to develop confirmation-dependent geotechnical engineering recommendations for the proposed SWM facilities to be constructed at the site. The scope of GTA's study included a field exploration and geotechnical engineering analyses. The field exploration included a total of 152 test pit excavations with in-situ infiltration testing and 60 basin flood tests within the proposed SWM basin areas. The conclusions and recommendations presented in this report were derived from engineering analyses of field data and details of the proposed SWM facilities as detailed herein.

1.2 Reference Documents

GTA was provided with a plan prepared by Bowman Consulting Group, Ltd. (Bowman) titled "Test Pit Location Map" dated September 19, 2023. The plan indicates the site boundaries, existing topography, and the layout and dimensions of the proposed SWM basins. The plan was marked up to show the locations of 152 requested test pits with infiltration testing within the proposed SWM basin areas, and 11 of the proposed basins were highlighted to indicate the areas where infiltration was a priority for design purposes. Those 11 basins include a total of 60 test locations, where basin flood testing was requested in addition to in-situ infiltration testing within the overburden soils.

2.0 PROJECT DESCRIPTION

2.1 Site Location

The site is situated north and west of Nursery Road, west of its intersection with Scotch Road. The general location of the site is shown on the Site Location Map, which is Figure 1 in Appendix A of this report.

2.2 Existing Site Conditions

At the time of our study, the central portion of the subject site was predominantly agricultural fields and wooded areas were present in the northwestern and southeastern portions of the site. An existing farm building was located in the southwestern corner of the site with an access drive leading from Nursery Road to the south. The northeastern corner of the site contained debris from

former structures that have since been demolished, and a cleared path led to the area of the former buildings from Nursery Road to the east. A stream running roughly northeast to southwest was present in the southeastern portion of the site, and mapped wetlands were indicated on the plan surrounding the stream channel. Another small stream was present in the northwestern corner of the site, and was also mapped as a wetlands area.

Based on our visual observations and review of the ground surface topography shown on the plan provided to us, the existing ground surface generally slopes gently across the site from about Elevation (EL) 220 feet in the northeastern corner to about EL 200 feet in the central portion of the site. From the central portion of the site, the ground surface slopes moderately down to about EL 150 feet in the southwestern corner of the site and to about EL 160 feet along the stream channels in the northwestern and southeastern corners.

2.3 Proposed SWM Basin Construction

Based on the plan provided to us, we understand that the proposed residential development will include a total of 48 SWM basins ranging in size from about 1,100 square feet to about 85,000 square feet. The plan also indicates 2 areas in the central and northwestern portions of the site where test pits were requested but the proposed basin boundaries were not outlined on the plan.

The project is in the preliminary phases of design and the grading plans have not yet been developed. As such, the proposed basin bottom elevations have not been determined. However, based on conversations with Bowman, we understand the basin bottoms will likely be established at about the central topographic contour within each basin to balance the amount of cuts and fills required for earthwork.

3.0 GEOTECHNICAL ENGINEERING STUDY

3.1 Geologic Review

The subject site is situated within the Piedmont physiographic province characterized by a low rolling plain divided by a series of higher ridges and predominantly underlain by sedimentary rocks of Triassic and Jurassic age. According to the *Surficial Geology of New Jersey* digital data map *(DGS07-2, 2013)* published as ESRI's Geographic Information Systems (GIS) shapefiles by the New Jersey Geological Survey as part of the Digital Geodata Series, the surficial geology of the majority of the site consists of weathered shale, mudstone, and sandstone. This unit is described as reddish-brown, yellow, and light gray silty sand to silty clay with shale, mudstone, or sandstone fragments. The weathered zone can be as much as 10 feet thick overlying shale and mudstone, and up to 30 feet thick overlying sandstone. The surficial geology of the southern portion of the site is mapped

as Aeolian deposits, which consist of yellow-brown and pale brown windblown fine sand and silt. The unit can be as much as 15 feet in thickness.

The site is underlain by the Passaic Formation of the Lower Jurassic and Upper Triassic Period of the Mesozoic Era, as shown on the *Bedrock Geologic Map of Central and Southern New Jersey (1998)* published by the United States Geological Survey. This formation is described as predominantly reddish-brown to maroon and purple, fine-grained sandstone, siltstone, and mudstone separated by olive-gray, dark-gray, or black siltstone or shale.

Please refer to the referenced publications for more detailed descriptions of the geologic members.

3.2 Subsurface Exploration

The subsurface exploration program consisted of excavating a total of 152 test pits with in-situ infiltration testing and performing 60 basin flood tests at the requested locations within the proposed SWM basin areas. The test pits were excavated on October 12, 2023 through November 15, 2023 by J.A. Neary Excavating using a Case CX160 excavator and extended to depths ranging from approximately 3 to 12 feet below the existing ground surface. In-situ infiltration testing was performed adjacent to each of the test pits using a double-ring infiltrometer. The exploration locations were selected, surveyed, and staked in the field by Bowman prior to our exploration. The approximate locations of the explorations performed for this study are shown on the Test Pit Location Plan, which is included as Figure 2 in Appendix A. Detailed descriptions of the subsurface conditions encountered in the test pits are indicated on the Logs of Test Pits, which are included in Appendix B. The ground surface elevations shown on the test pit logs were provided by Bowman. The stakes for Test Pits TP-1131 and TP-1132 could not be located in the field. Therefore, the test pits were located in the field by GTA using a hand-held GPS unit and the ground surface elevations were estimated by interpolating between topographic contours shown on the plans provided to us.

The soil samples retrieved from the test pits were delivered to GTA's laboratory for visual classification by a geotechnical engineer and limited laboratory testing. The soil descriptions indicated on the logs are based on visual observations of the individual soil samples as summarized in the Notes for Exploration Logs included in Appendix B, supplemented by the laboratory test results.

3.3 Subsurface Conditions

The results of the subsurface exploration were, for the most part, consistent with the known site history and geologic mapping of the project site. The specific subsurface conditions at each

exploration location are shown on the individual exploration logs within Appendix B. GTA has summarized the subsurface conditions encountered in the following sections.

3.3.1 Surficial Materials

An approximately 6- to 12-inch-thick layer of topsoil was encountered at the ground surface in all of the explorations performed for this study, averaging about 10 inches. The reported topsoil thicknesses generally represent the upper layer of dark and organic soil.

3.3.2 Existing Fill

Two of the explorations performed for this study (TP-1135 and TP-1136) encountered materials that GTA representatives visually identified as existing fill materials. These explorations were performed in an area of the site that was once developed with residential homes that have been razed. The encountered fill generally extended to depths ranging from about 2 to 4 feet below the ground surface and predominantly consisted of sandy silts with gravel and contained debris including bricks, concrete fragments, plastic, scrap metal, and an abandoned utility line.

3.3.3 Native Soils

Beneath the topsoil and existing fill, where present, the explorations encountered native surficial soils consistent with the geologic mapping of the site. The subsurface profile predominantly consisted of silts with varying amounts of granular materials (ML), silty sands (SM), and silty gravel (GM) soils that graded into highly weathered shale bedrock at all of the exploration locations.

3.3.4 Weathered Rock

GTA defines highly weathered rock (HWR) in test pits by visual identification of the rock plate sizes and increased excavation effort. The surface of HWR was encountered in all of the explorations performed for this study at depths ranging from about 1 to 8 feet below the existing surface grades. Refusal to further excavation was encountered in the test pits at depths ranging from about 4 to 12 feet below the ground surface which can be indicative of more competent bedrock materials.

3.3.5 Groundwater

Groundwater was not encountered in the test pits performed for this study. However, seepage of perched or trapped water was observed in 9 of the test pits (TP-1002, TP-1006, TP-1007, TP-1014, TP-1057, TP-1062, TP-1063, TP-1102, and TP-1150) at depths ranging from about 5 to 10 feet below the ground surface. Perched water conditions should be anticipated at varying depths throughout the site in areas where granular soils are underlain by less permeable, fine-grained soils or rock.

Soil mottling indicative of the seasonal high groundwater (SHGW) level was not observed in the test pits performed for this study. Therefore, we believe the SHGW table is below the depths excavated in the test pits.

3.4 Laboratory Testing

Laboratory testing performed for this study included grain-size distribution and Atterberg limits testing for classification of the soils in accordance with the Unified Soil Classification System (USCS), as well as natural moisture content determinations. Detailed results of the laboratory testing performed for this study are included in Appendix C. The results of the laboratory tests are summarized in the following table:

3.5 Infiltration Test Results

In-situ infiltration testing was performed within the overburden soils at 147 of the 152 test pit locations at depths ranging from about 6 inches to 5 feet below the existing surface grades. The tests were performed using a double-ring infiltrometer in general accordance with Chapter 12 of the New Jersey Stormwater Best Management Practices Manual (Chapter 12). Infiltration tests were attempted at the remaining 5 locations; however, the equipment could not be properly seated to prevent leaking due to the amount of gravel and shale fragments within the soils to be tested, and the tests were abandoned.

The depths of the tests performed at the site and measured infiltration rates are summarized in the Subsurface Summary Table included in Appendix C.

3.6 Basin Flood Test Results

Due to the presence of shallow bedrock at the site, basin flood testing was performed at 60 locations to establish the permeability rate of the bedrock in accordance with Subsection A3 of Chapter 12. A basin flood test involves excavating a “basin” with a minimum bottom area of 50 square feet. If groundwater is observed within the basin, the basin flood test shall not be used. If no groundwater is observed, the basin shall be filled with 12 inches (about 375 gallons) of water and allowed to drain completely. If the time required for the basin to drain is greater than 24 hours, the test shall be terminated, and the rock shall be considered to be a massive rock substratum. If the basin drains completely within 24 hours, the basin shall be filled with another 12 inches of water. If the basin drains completely within 24 hours of the second filling, the rock shall be

considered to be fractured rock substratum, and suitable for infiltration with a design infiltration rate of 0.5 inches per hour.

Sixty basins with dimensions of approximately 10 feet by 5 feet were excavated at the requested locations. The excavations for the basin flood tests were terminated at depths ranging from about 4 to 9½ feet below the ground surface within the weathered rock that was encountered. Following excavation, the basins were filled with 12 inches of water and the water levels were checked 24 hours after filling. Following the initial 24-hour presoak period, it was observed that 39 of the basins did not drain completely. Therefore, the shale bedrock at these locations should be considered a massive rock substratum per Chapter 12 and is not suitable for infiltration.

Following the initial 24-hour presoak period, it was observed that the water drained completely from within the remaining 21 basins. These basins were refilled to 12 inches above the basin bottom levels. Following the second 24-hour period, it was observed that all 21 basins had completely drained again. Therefore, per Chapter 12, the shale bedrock at these locations should be classified as a fractured rock substratum with a design infiltration rate of 0.5 inches per hour.

Please refer to the Subsurface Summary Table included in Appendix C for more detailed information regarding the individual test locations and depths of basin flood tests performed.

4.0 CONCLUSIONS

The primary conditions that affect the capacity to infiltrate water are the soil gradation and density properties and the presence of hydraulically restrictive layers such as silt or clay (fines), rock, or groundwater, each of which would restrict the flow of water into the underlying aquifer. The subsurface profile encountered at the site generally consisted of fine-grained soils (ML, CL) and residual silty sand (SM) and silty gravel (GM) soils, overlying highly weathered shale bedrock. The surface of weathered rock was encountered in all of the explorations performed for this study at depths ranging from about 1 to 8 feet below the existing surface grades. Static groundwater seepage was not observed in the test pits.

In general, the more granular portions of the residual overburden soils tested generally appeared receptive to infiltration with measured infiltration rates ranging up to 24 inches per hour. However, the fine-grained residual soils and the granular residual soils containing appreciable amounts of fines were generally not receptive or only slightly receptive to infiltration, which is typical for soils with high fines contents. The overall results of the testing across the site resulted in variable infiltration rates: 92 of the 147 locations tested (approximately 63%) resulted in a measured infiltration rate of zero (0) inches per hour, 34 of the locations tested (approximately 23%) resulted

in infiltration rates of less than 1 inch per hour, and the remaining 21 of the locations (approximately 14%) resulted in infiltration rates greater than 1 inch per hour.

Chapter 12 requires that infiltration tests be performed within the most restrictive layer within 8 feet of the proposed infiltration elevations. Therefore, per the Chapter 12 guidance, basin flood testing was performed to establish the permeability rate of the bedrock at 60 requested locations. The basin flood tests failed at 39 of the 60 test locations and passed at the remaining 21 locations. The mixed results are typical for the site geology.

5.0 ADDITIONAL SERVICES

We recommended that GTA be retained during construction of the subject project to provide geotechnical consultation and construction observation and testing services as outlined below:

- Review final site plans to evaluate if they conform to the intent of this report.
- Provide on-site observation during SWM basin construction.
- Perform infiltration testing following construction of the proposed SWM basins to verify design rate.

6.0 LIMITATIONS

This report, including all supporting test pit logs, field data, field notes, laboratory test data, calculations, estimates and other documents prepared by GTA in connection with this Project have been prepared for the exclusive use of US Home Corporation (Lennar; Client) pursuant to the Agreement between GTA and Client dated October 2, 2023, and in accordance with generally accepted engineering practice. All terms and conditions set forth in the Agreement and the General Provisions attached thereto are incorporated herein by reference. No warranty, express or implied, is made herein. Use and reproduction of this report by any other person without the expressed written permission of GTA and Client is unauthorized and such use is at the sole risk of the user.

The analysis and recommendations contained in this report are based on the data obtained from limited observation and testing of the encountered materials. Test pits indicate subsurface conditions only at specific locations and times, and only at the depths penetrated. They do not necessarily reflect strata or variations that may exist between the exploration locations. Consequently, the analysis and recommendations must be considered preliminary until the subsurface conditions can be verified by direct observation at the time of construction. If variations of subsurface conditions from those described in this report are noted during construction, recommendations in this report may need to be re-evaluated.

In the event that any changes in the nature, design, or location of the facilities are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed, and conclusions of this report are verified in writing. GTA is not responsible for any claims, damages, or liability associated with interpretation of subsurface data or reuse of the subsurface data or engineering analysis without the expressed written authorization of GTA.

The scope of our services for this geotechnical exploration did not include any environmental assessment or investigation for the presence or absence of wetlands, or hazardous or toxic materials in the soil, surface water, groundwater, or air, on or below or around this site. Any statements in this report or on the logs regarding odors or unusual or suspicious items or conditions observed are strictly for the information of our Client.

This report and the attached logs are instruments of service. The subject matter of this report is limited to the facts and matters stated herein. Absence of a reference to any other conditions or subject matter shall not be construed by the reader to imply approval by the writer.

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, you can benefit from a lowered exposure to problems associated with subsurface conditions at project sites and development of them that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed herein, contact your GBA-member geotechnical engineer. Active engagement in GBA exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Understand the Geotechnical-Engineering Services Provided for this Report

Geotechnical-engineering services typically include the planning, collection, interpretation, and analysis of exploratory data from widely spaced borings and/or test pits. Field data are combined with results from laboratory tests of soil and rock samples obtained from field exploration (if applicable), observations made during site reconnaissance, and historical information to form one or more models of the expected subsurface conditions beneath the site. Local geology and alterations of the site surface and subsurface by previous and proposed construction are also important considerations. Geotechnical engineers apply their engineering training, experience, and judgment to adapt the requirements of the prospective project to the subsurface model(s). Estimates are made of the subsurface conditions that will likely be exposed during construction as well as the expected performance of foundations and other structures being planned and/or affected by construction activities.

The culmination of these geotechnical-engineering services is typically a geotechnical-engineering report providing the data obtained, a discussion of the subsurface model(s), the engineering and geologic engineering assessments and analyses made, and the recommendations developed to satisfy the given requirements of the project. These reports may be titled investigations, explorations, studies, assessments, or evaluations. Regardless of the title used, the geotechnical-engineering report is an engineering interpretation of the subsurface conditions within the context of the project and does not represent a close examination, systematic inquiry, or thorough investigation of all site and subsurface conditions.

Geotechnical-Engineering Services are Performed for Specific Purposes, Persons, and Projects, and At Specific Times

Geotechnical engineers structure their services to meet the specific needs, goals, and risk management preferences of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client.

Likewise, geotechnical-engineering services are performed for a specific project and purpose. For example, it is unlikely that a geotechnical-engineering study for a refrigerated warehouse will be the same as one prepared for a parking garage; and a few borings drilled during a preliminary study to evaluate site feasibility will not be adequate to develop geotechnical design recommendations for the project.

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project or purpose;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, the reliability of a geotechnical-engineering report can be affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying the recommendations in it. A minor amount of additional testing or analysis after the passage of time – if any is required at all – could prevent major problems.

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read the report in its entirety. Do not rely on an executive summary. Do not read selective elements only. *Read and refer to the report in full.*

You Need to Inform Your Geotechnical Engineer About Change

Your geotechnical engineer considered unique, project-specific factors when developing the scope of study behind this report and developing the confirmation-dependent recommendations the report conveys. Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the elevation, configuration, location, orientation, function or weight of the proposed structure and the desired performance criteria;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project or site changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept*

responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface using various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing is performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgement to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team through project completion to obtain informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, they are not final, because the geotechnical engineer who developed them relied heavily on judgement and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* exposed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a continuing member of the design team, to:

- confer with other design-team members;
- help develop specifications;
- review pertinent elements of other design professionals' plans and specifications; and
- be available whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction-phase observations.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for information purposes only.* To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. This happens in part because soil and rock on project sites are typically heterogeneous and not manufactured materials with well-defined engineering properties like steel and concrete. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually provide environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures.* If you have not obtained your own environmental information about the project site, ask your geotechnical consultant for a recommendation on how to find environmental risk-management guidance.

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, the engineer's services were not designed, conducted, or intended to prevent migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration. Confront the risk of moisture infiltration*** by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

					OL
		ELASTIC SILTS AND FAT CLAYS LIQUID LIMIT GREATER THAN 50			MH
					CH
					OH
HIGHLY ORGANIC SOILS					PT

NOTE: DUAL SYMBOLS ARE USED TO INDICATE COARSE-GRAINED SOILS WHICH CONTAIN AN ESTIMATED 5 TO 15% FINES BASED ON VISUAL CLASSIFICATION OR BETWEEN 5 AND 12% FINES BASED ON LABORATORY TESTING; AND FINE-GRAINED SOILS WHEN THE PLOT OF LIQUID LIMIT & PLASTICITY INDEX VALUES FALLS IN THE PLASTICITY CHART'S CROSS-HATCHED AREA. FINE-GRAINED SOILS ARE CLASSIFIED AS ORGANIC (OL OR OH) WHEN ENOUGH ORGANIC PARTICLES ARE PRESENT TO INFLUENCE ITS PROPERTIES. LABORATORY TEST RESULTS ARE USED TO SUPPLEMENT SOIL CLASSIFICATION BY THE VISUAL-MANUAL PROCEDURES OF ASTM D 2488.

Summary for Pond B-21: Basin #21

Inflow Area = 2.500 ac, 35.44% Impervious, Inflow Depth = 1.84" for Current 2 yr event
Inflow = 4.64 cfs @ 12.18 hrs, Volume= 0.383 af
Outflow = 0.18 cfs @ 15.27 hrs, Volume= 0.282 af, Atten= 96%, Lag= 185.8 min
Primary = 0.18 cfs @ 15.27 hrs, Volume= 0.282 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 151.95' @ 15.27 hrs Surf.Area= 6,708 sf Storage= 11,461 cf

Plug-Flow detention time= 676.7 min calculated for 0.281 af (73% of inflow)
Center-of-Mass det. time= 579.2 min (1,381.9 - 802.7)

Summary for Pond B-27: Basin #27

Inflow Area = 1.935 ac, 46.41% Impervious, Inflow Depth = 2.50" for Current 2 yr event
Inflow = 4.97 cfs @ 12.17 hrs, Volume= 0.403 af
Outflow = 1.61 cfs @ 12.45 hrs, Volume= 0.296 af, Atten= 68%, Lag= 16.7 min
Primary = 1.61 cfs @ 12.45 hrs, Volume= 0.296 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 171.73' @ 12.45 hrs Surf.Area= 3,461 sf Storage= 8,404 cf

Plug-Flow detention time= 203.7 min calculated for 0.296 af (73% of inflow)
Center-of-Mass det. time= 112.4 min (901.0 - 788.6)

Summary for Pond B-27: Basin #27

Inflow Area = 1.935 ac, 46.41% Impervious, Inflow Depth = 4.16" for Current 10 yr event
Inflow = 8.17 cfs @ 12.17 hrs, Volume= 0.672 af
Outflow = 5.69 cfs @ 12.27 hrs, Volume= 0.565 af, Atten= 30%, Lag= 6.2 min
Primary = 5.69 cfs @ 12.27 hrs, Volume= 0.565 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 172.37' @ 12.27 hrs Surf.Area= 3,824 sf Storage= 10,783 cf

Plug-Flow detention time= 155.9 min calculated for 0.564 af (84% of inflow)
Center-of-Mass det. time= 86.7 min (865.5 - 778.8)

Summary for Pond B-21: Basin #21

Inflow Area = 2.500 ac, 35.44% Impervious, Inflow Depth = 6.48" for Current 100 yr event
Inflow = 16.61 cfs @ 12.17 hrs, Volume= 1.350 af
Outflow = 11.94 cfs @ 12.27 hrs, Volume= 1.217 af, Atten= 28%, Lag= 5.8 min
Primary = 11.94 cfs @ 12.27 hrs, Volume= 1.217 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 153.29' @ 12.27 hrs Surf.Area= 8,118 sf Storage= 21,399 cf

Plug-Flow detention time= 283.1 min calculated for 1.217 af (90% of inflow)
Center-of-Mass det. time= 231.9 min (1,017.5 - 785.7)

Summary for Pond B-27: Basin #27

Inflow Area = 1.935 ac, 46.41% Impervious, Inflow Depth = 7.58" for Current 100 yr event
Inflow = 14.53 cfs @ 12.17 hrs, Volume= 1.222 af
Outflow = 13.24 cfs @ 12.22 hrs, Volume= 1.114 af, Atten= 9%, Lag= 2.9 min
Primary = 13.24 cfs @ 12.22 hrs, Volume= 1.114 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 172.77' @ 12.22 hrs Surf.Area= 3,990 sf Storage= 12,338 cf

Plug-Flow detention time= 113.2 min calculated for 1.114 af (91% of inflow)
Center-of-Mass det. time= 66.2 min (833.7 - 767.5)

Summary for Pond B-21: Basin #21

Inflow Area = 2.500 ac, 35.44% Impervious, Inflow Depth = 2.24" for Future 2 yr event
Inflow = 5.71 cfs @ 12.17 hrs, Volume= 0.467 af
Outflow = 0.21 cfs @ 15.49 hrs, Volume= 0.353 af, Atten= 96%, Lag= 198.7 min
Primary = 0.21 cfs @ 15.49 hrs, Volume= 0.353 af
Routed to Link PDA-2 : Proposed Drainage Area #2

Routing by Stor-Ind method, Time Span= 0.00-40.00 hrs, dt= 0.05 hrs
Peak Elev= 152.33' @ 15.49 hrs Surf.Area= 7,105 sf Storage= 14,115 cf

Plug-Flow detention time= 717.6 min calculated for 0.353 af (76% of inflow)
Center-of-Mass det. time= 623.6 min (1,424.3 - 800.6)
